

Convolution log-likelihood for one bulk sample (means fixed; only p varies).
Surface values are $L / \max(L) = \exp(\ell l - \max \ell l)$, shown on a $\log_{10}$ z-axis.
White point: true p^* . Red point: numerical MLE. One shared legend for all four panels on the page.

Convolution log-likelihood for one bulk sample (means fixed; only p varies).
Surface values are $L / \max(L) = \exp(\ell I - \max \ell I)$, shown on a log10 z-axis.
White point: true p^* . Red point: numerical MLE. One shared legend for all four panels on the page.

Convolution log-likelihood for one bulk sample (means fixed; only p varies).
Surface values are $L / \max(L) = \exp(\ell l - \max \ell l)$, shown on a $\log_{10}$ z-axis.
White point: true p^* . Red point: numerical MLE. One shared legend for all four panels on the page.

◇ true p^* ● numerical MLE

Convolution log-likelihood for one bulk sample (means fixed; only p varies).
Surface values are $L / \max(L) = \exp(\ell l - \max \ell l)$, shown on a log10 z-axis.
