

small_CLD / homoscedastic / balanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

small_CLD / homoscedastic / moderately unbalanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

small_CLD / homoscedastic / highly unbalanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

small_CLD / heteroscedastic / balanced

small_CLD / heteroscedastic / moderately unbalanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

small_CLD / heteroscedastic / highly unbalanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

large_CLD / homoscedastic / balanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

large_CLD / homoscedastic / moderately unbalanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

large_CLD / homoscedastic / highly unbalanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

large_CLD / heteroscedastic / balanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

large_CLD / heteroscedastic / moderately unbalanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

large_CLD / heteroscedastic / highly unbalanced

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.
