

balanced / low OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: $\alpha = 0.05$. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

balanced / moderate OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

balanced / high OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

moderately unbalanced / low OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

moderately unbalanced / moderate OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

moderately unbalanced / high OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

highly unbalanced / low OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

highly unbalanced / moderate OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.

highly unbalanced / high OVL

One KS score per scenario x solver (whitened ILR coordinates pooled). Dashed line: alpha = 0.05. Below 0.05 we reject normality of the Monte Carlo distribution at the conventional 5% level.
