Convergence: theoretical success, theoretical and numerical failures

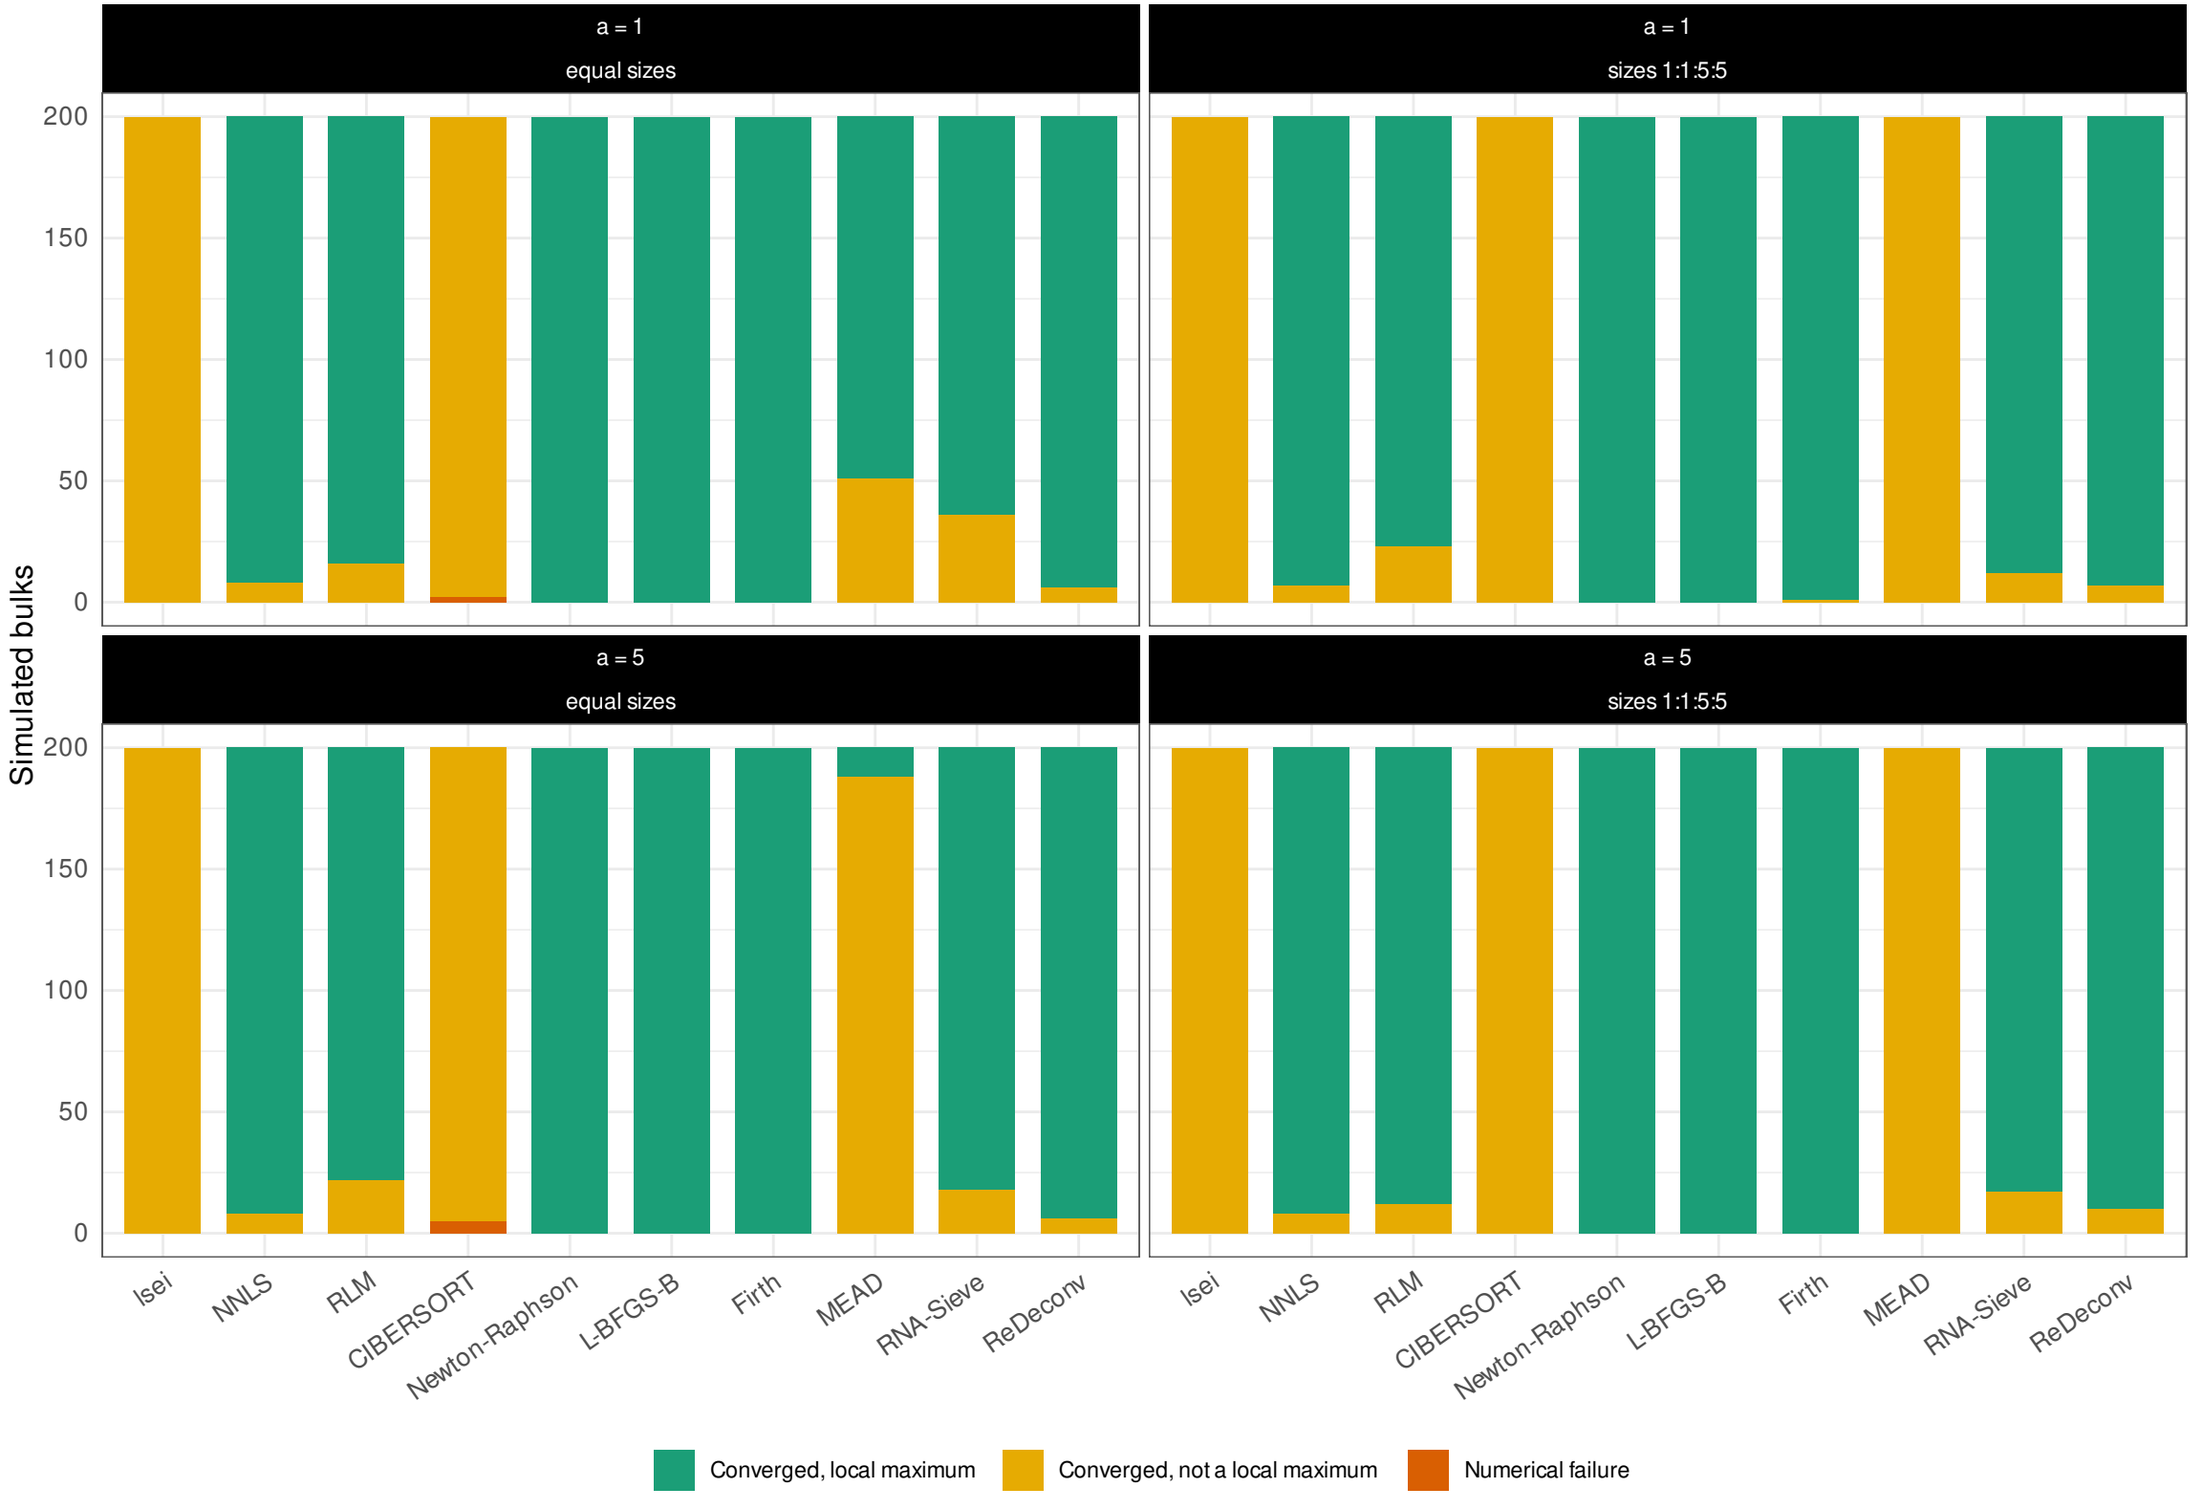

G = 20 / 1000 cells per bulk / balanced / low sibling overlap

Numerical failure: no finite estimate on the simplex. Theoretical failure: a finite estimate that is not a local maximum of the DeCovarT likelihood.

Convergence: theoretical success, theoretical and numerical failures

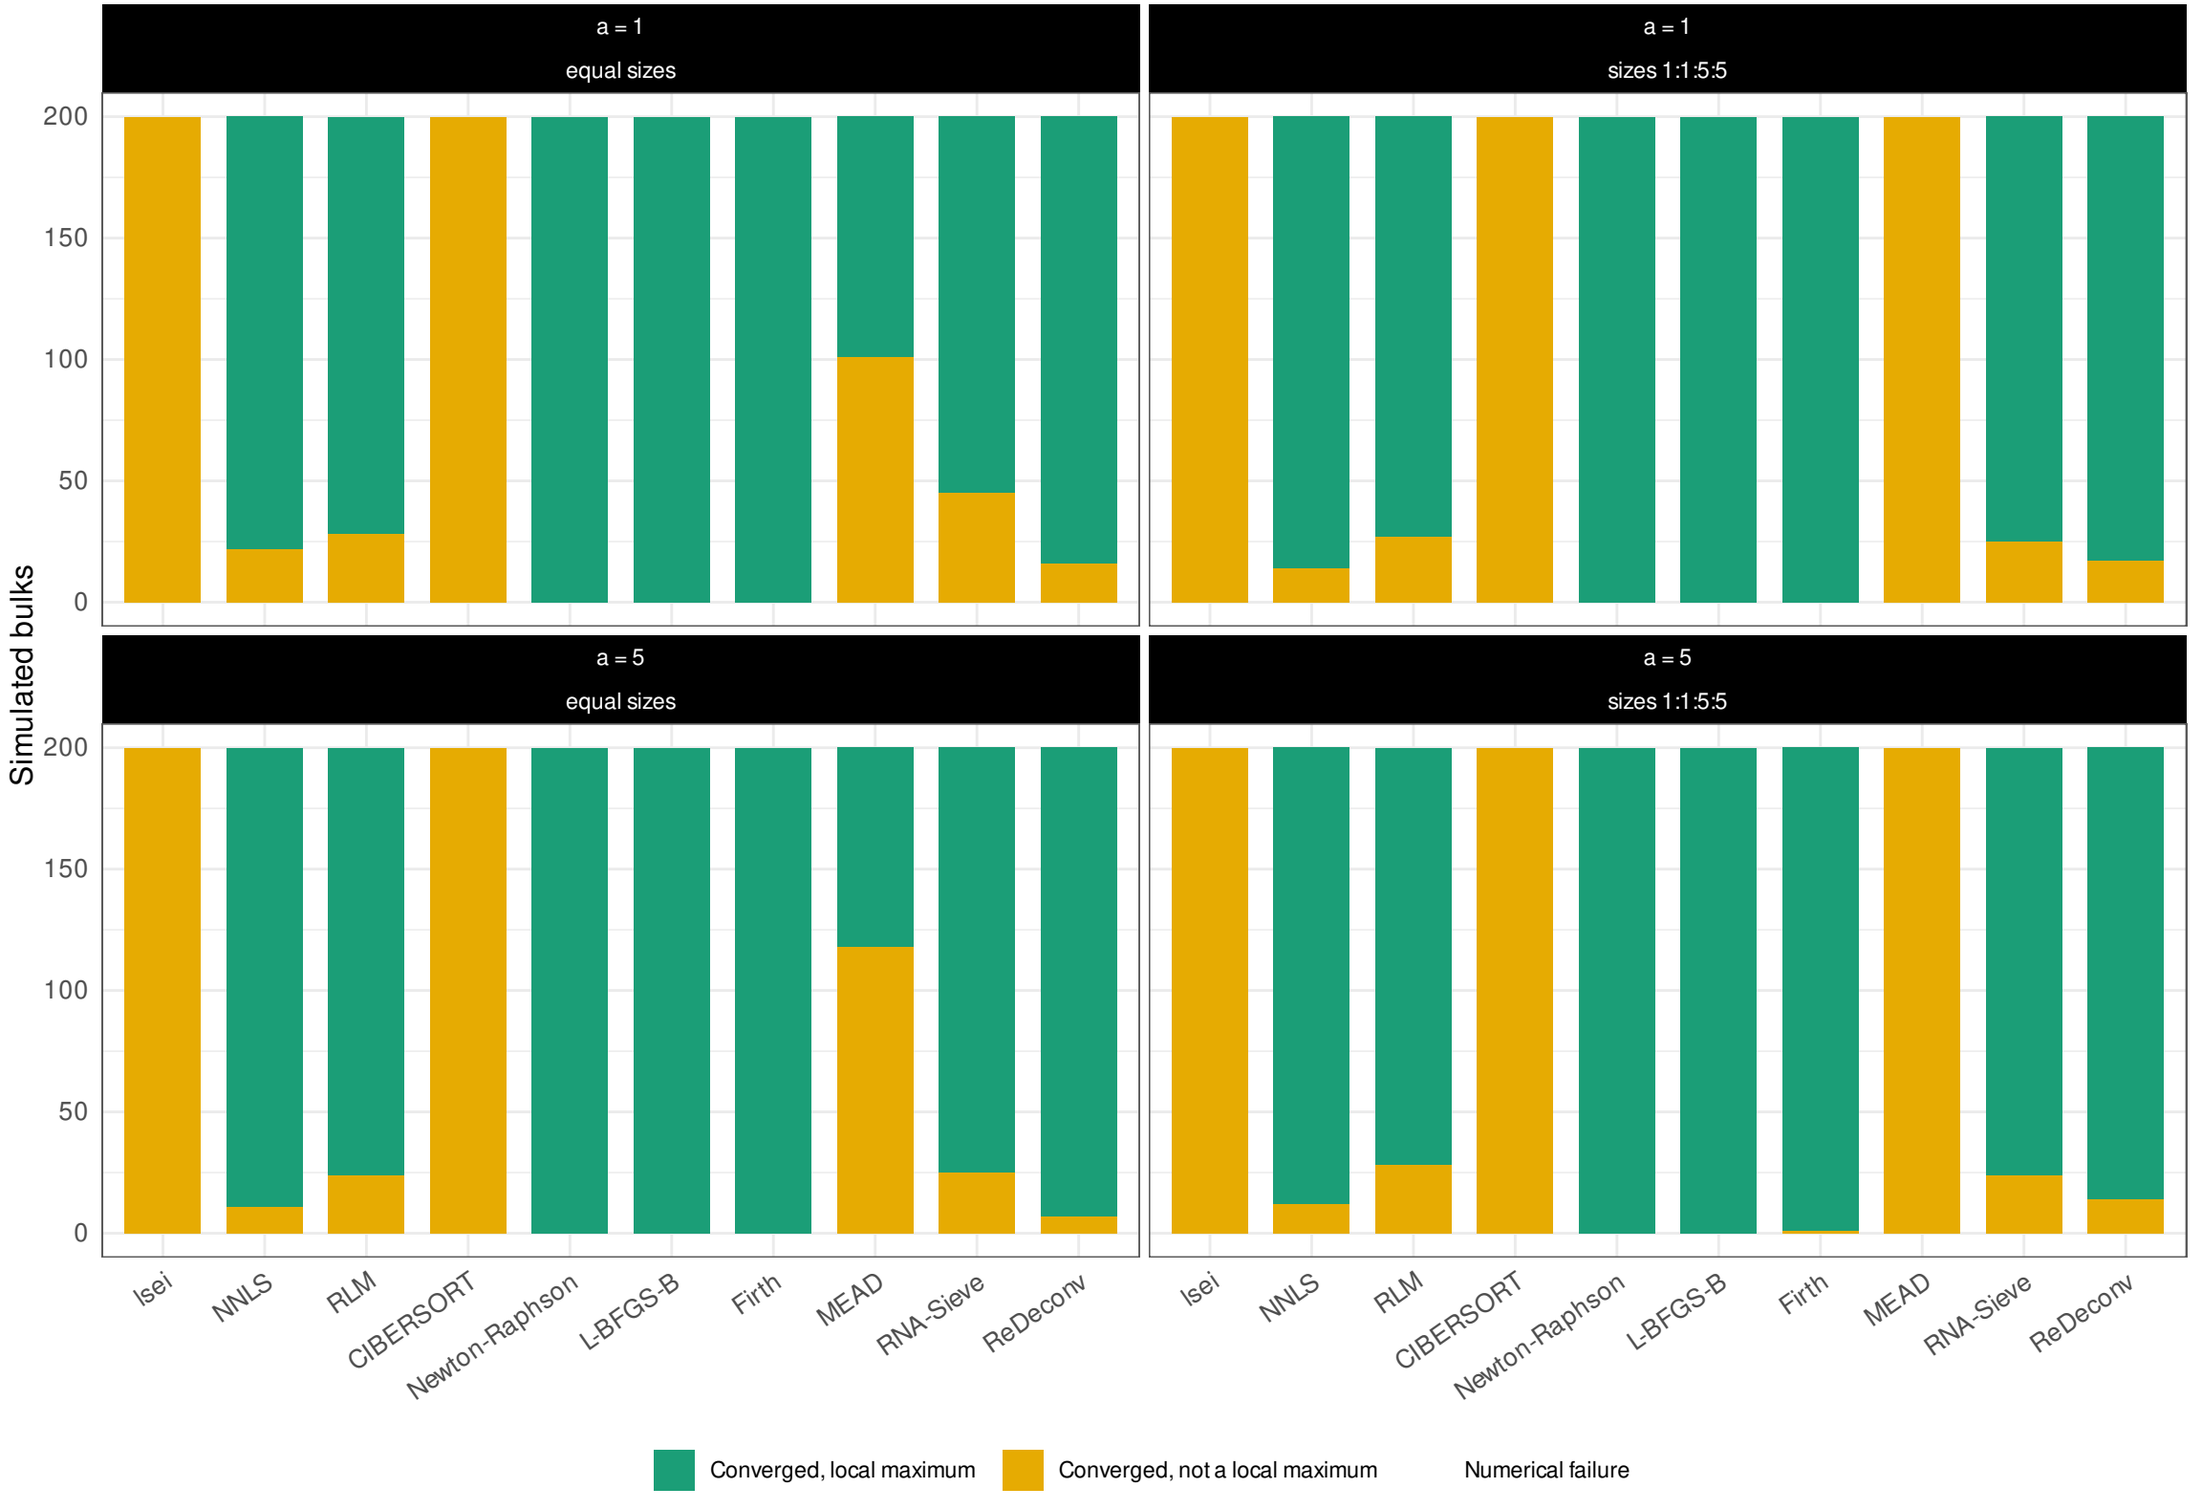

G = 20 / 1000 cells per bulk / balanced / high sibling overlap

Numerical failure: no finite estimate on the simplex. Theoretical failure: a finite estimate that is not a local maximum of the DeCovarT likelihood.

Convergence: theoretical success, theoretical and numerical failures

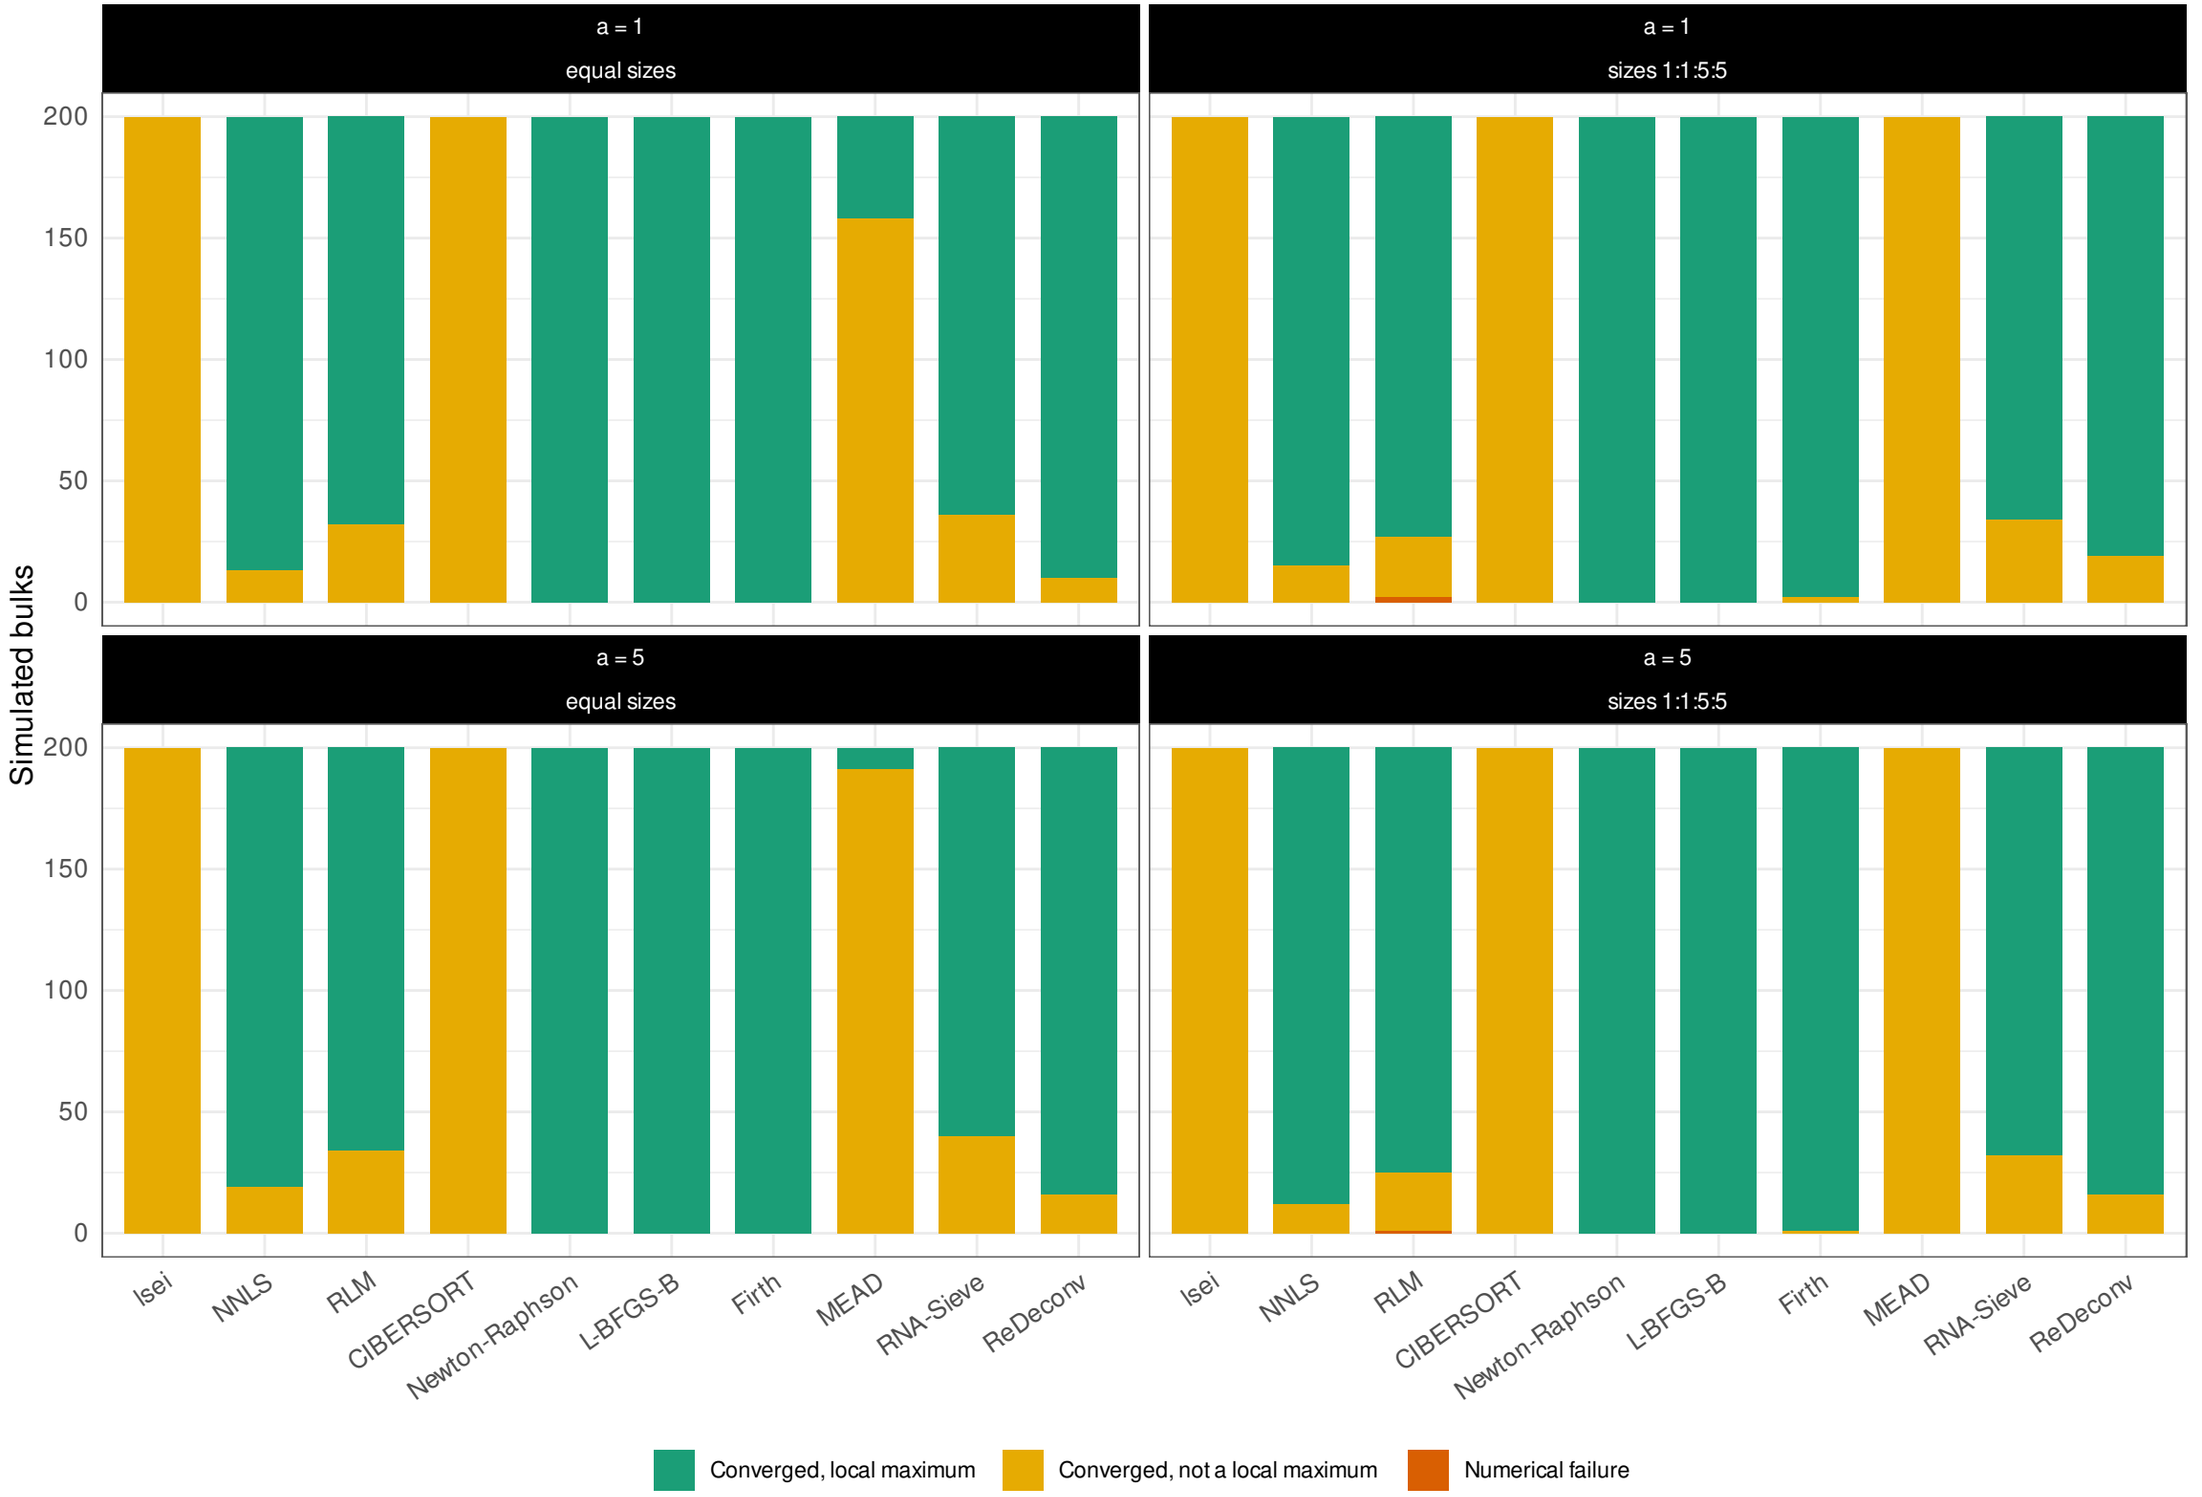

G = 20 / 1000 cells per bulk / unbalanced / low sibling overlap

Numerical failure: no finite estimate on the simplex. Theoretical failure: a finite estimate that is not a local maximum of the DeCovarT likelihood.

Convergence: theoretical success, theoretical and numerical failures

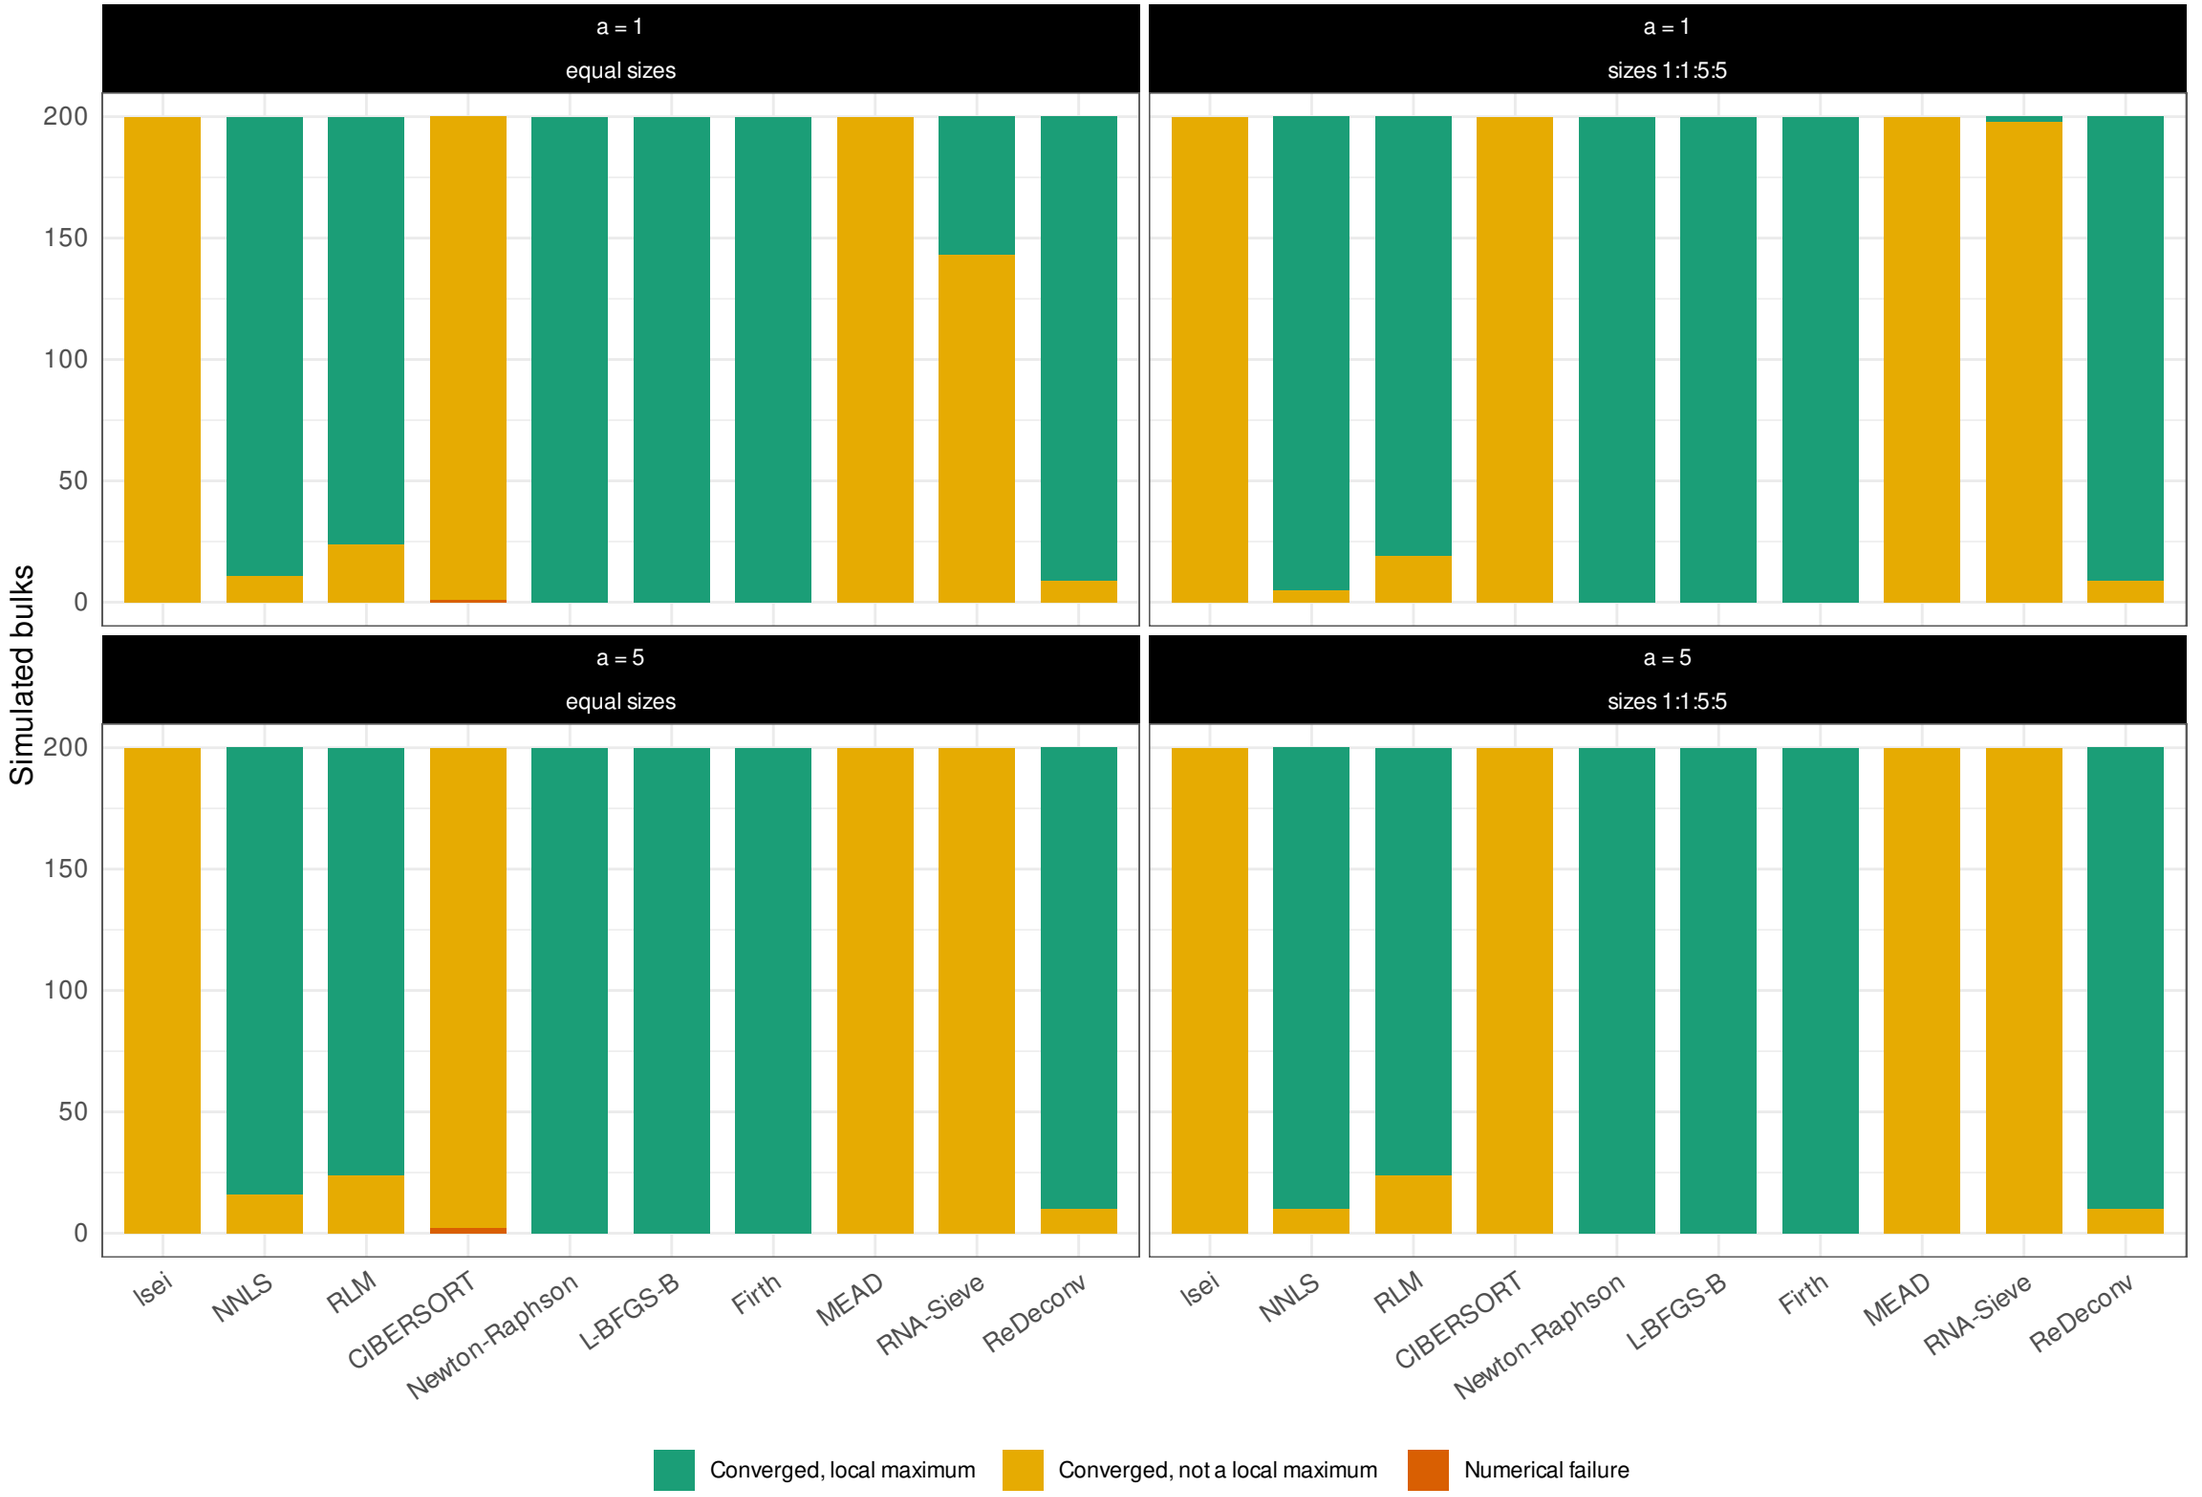

G = 20 / 1000 cells per bulk / unbalanced / high sibling overlap

Numerical failure: no finite estimate on the simplex. Theoretical failure: a finite estimate that is not a local maximum of the DeCovarT likelihood.

Convergence: theoretical success, theoretical and numerical failures

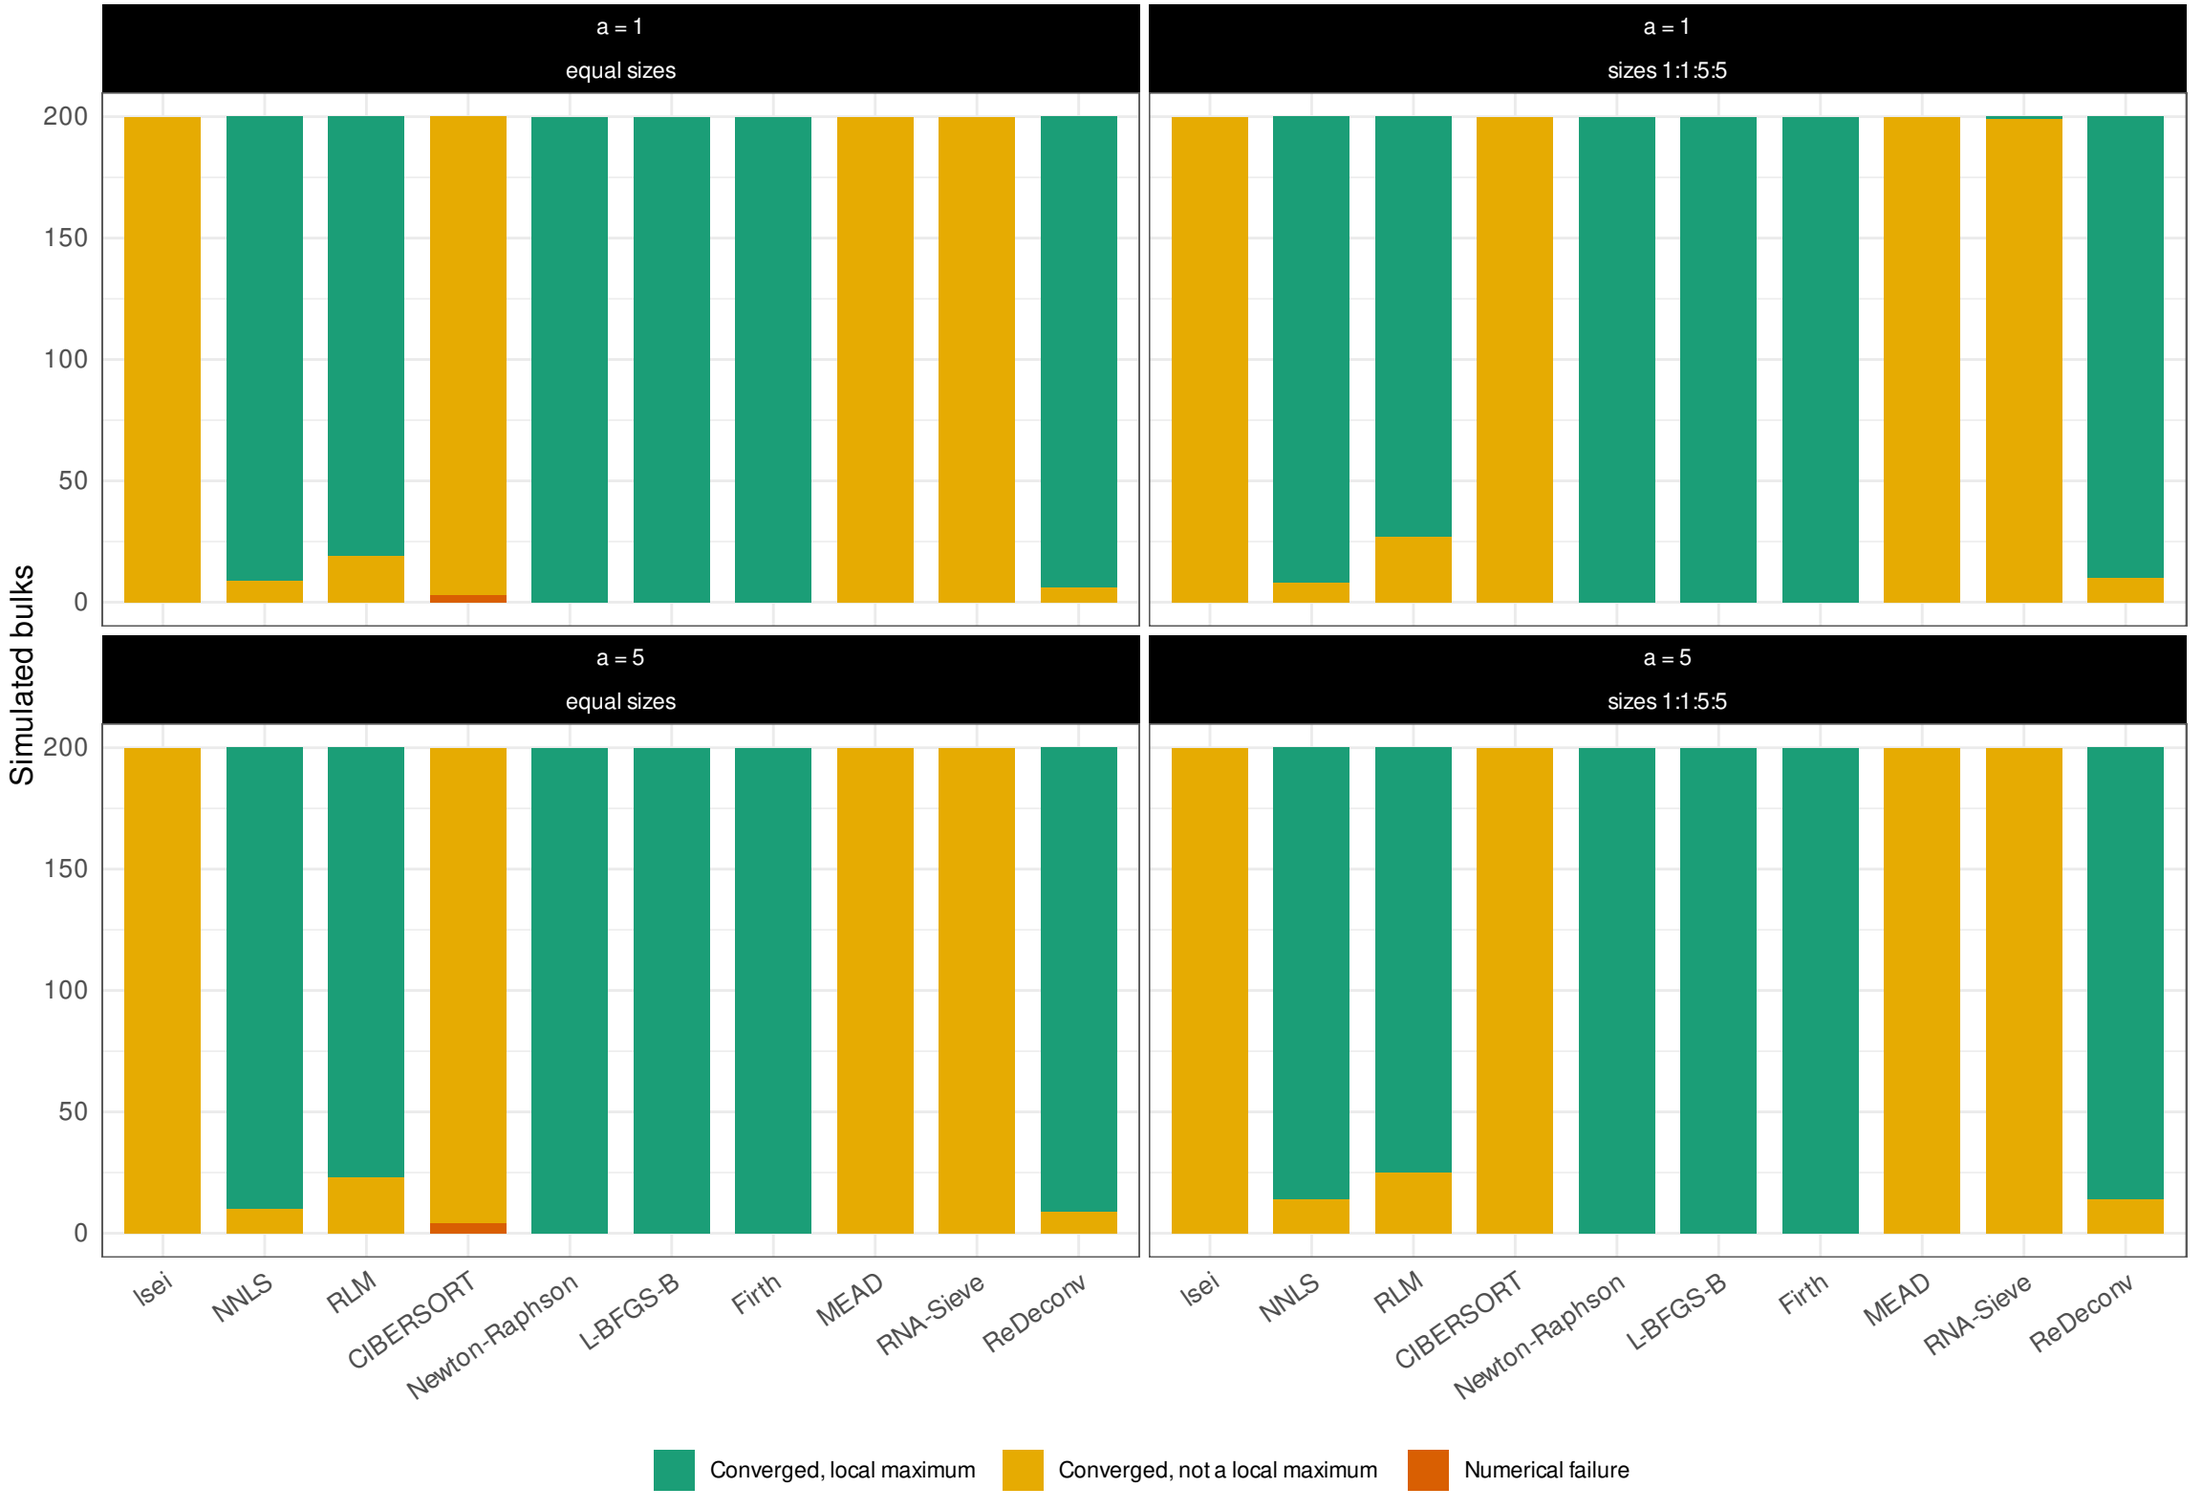

G = 20 / 1e+05 cells per bulk / balanced / low sibling overlap

Numerical failure: no finite estimate on the simplex. Theoretical failure: a finite estimate that is not a local maximum of the DeCovarT likelihood.

Convergence: theoretical success, theoretical and numerical failures

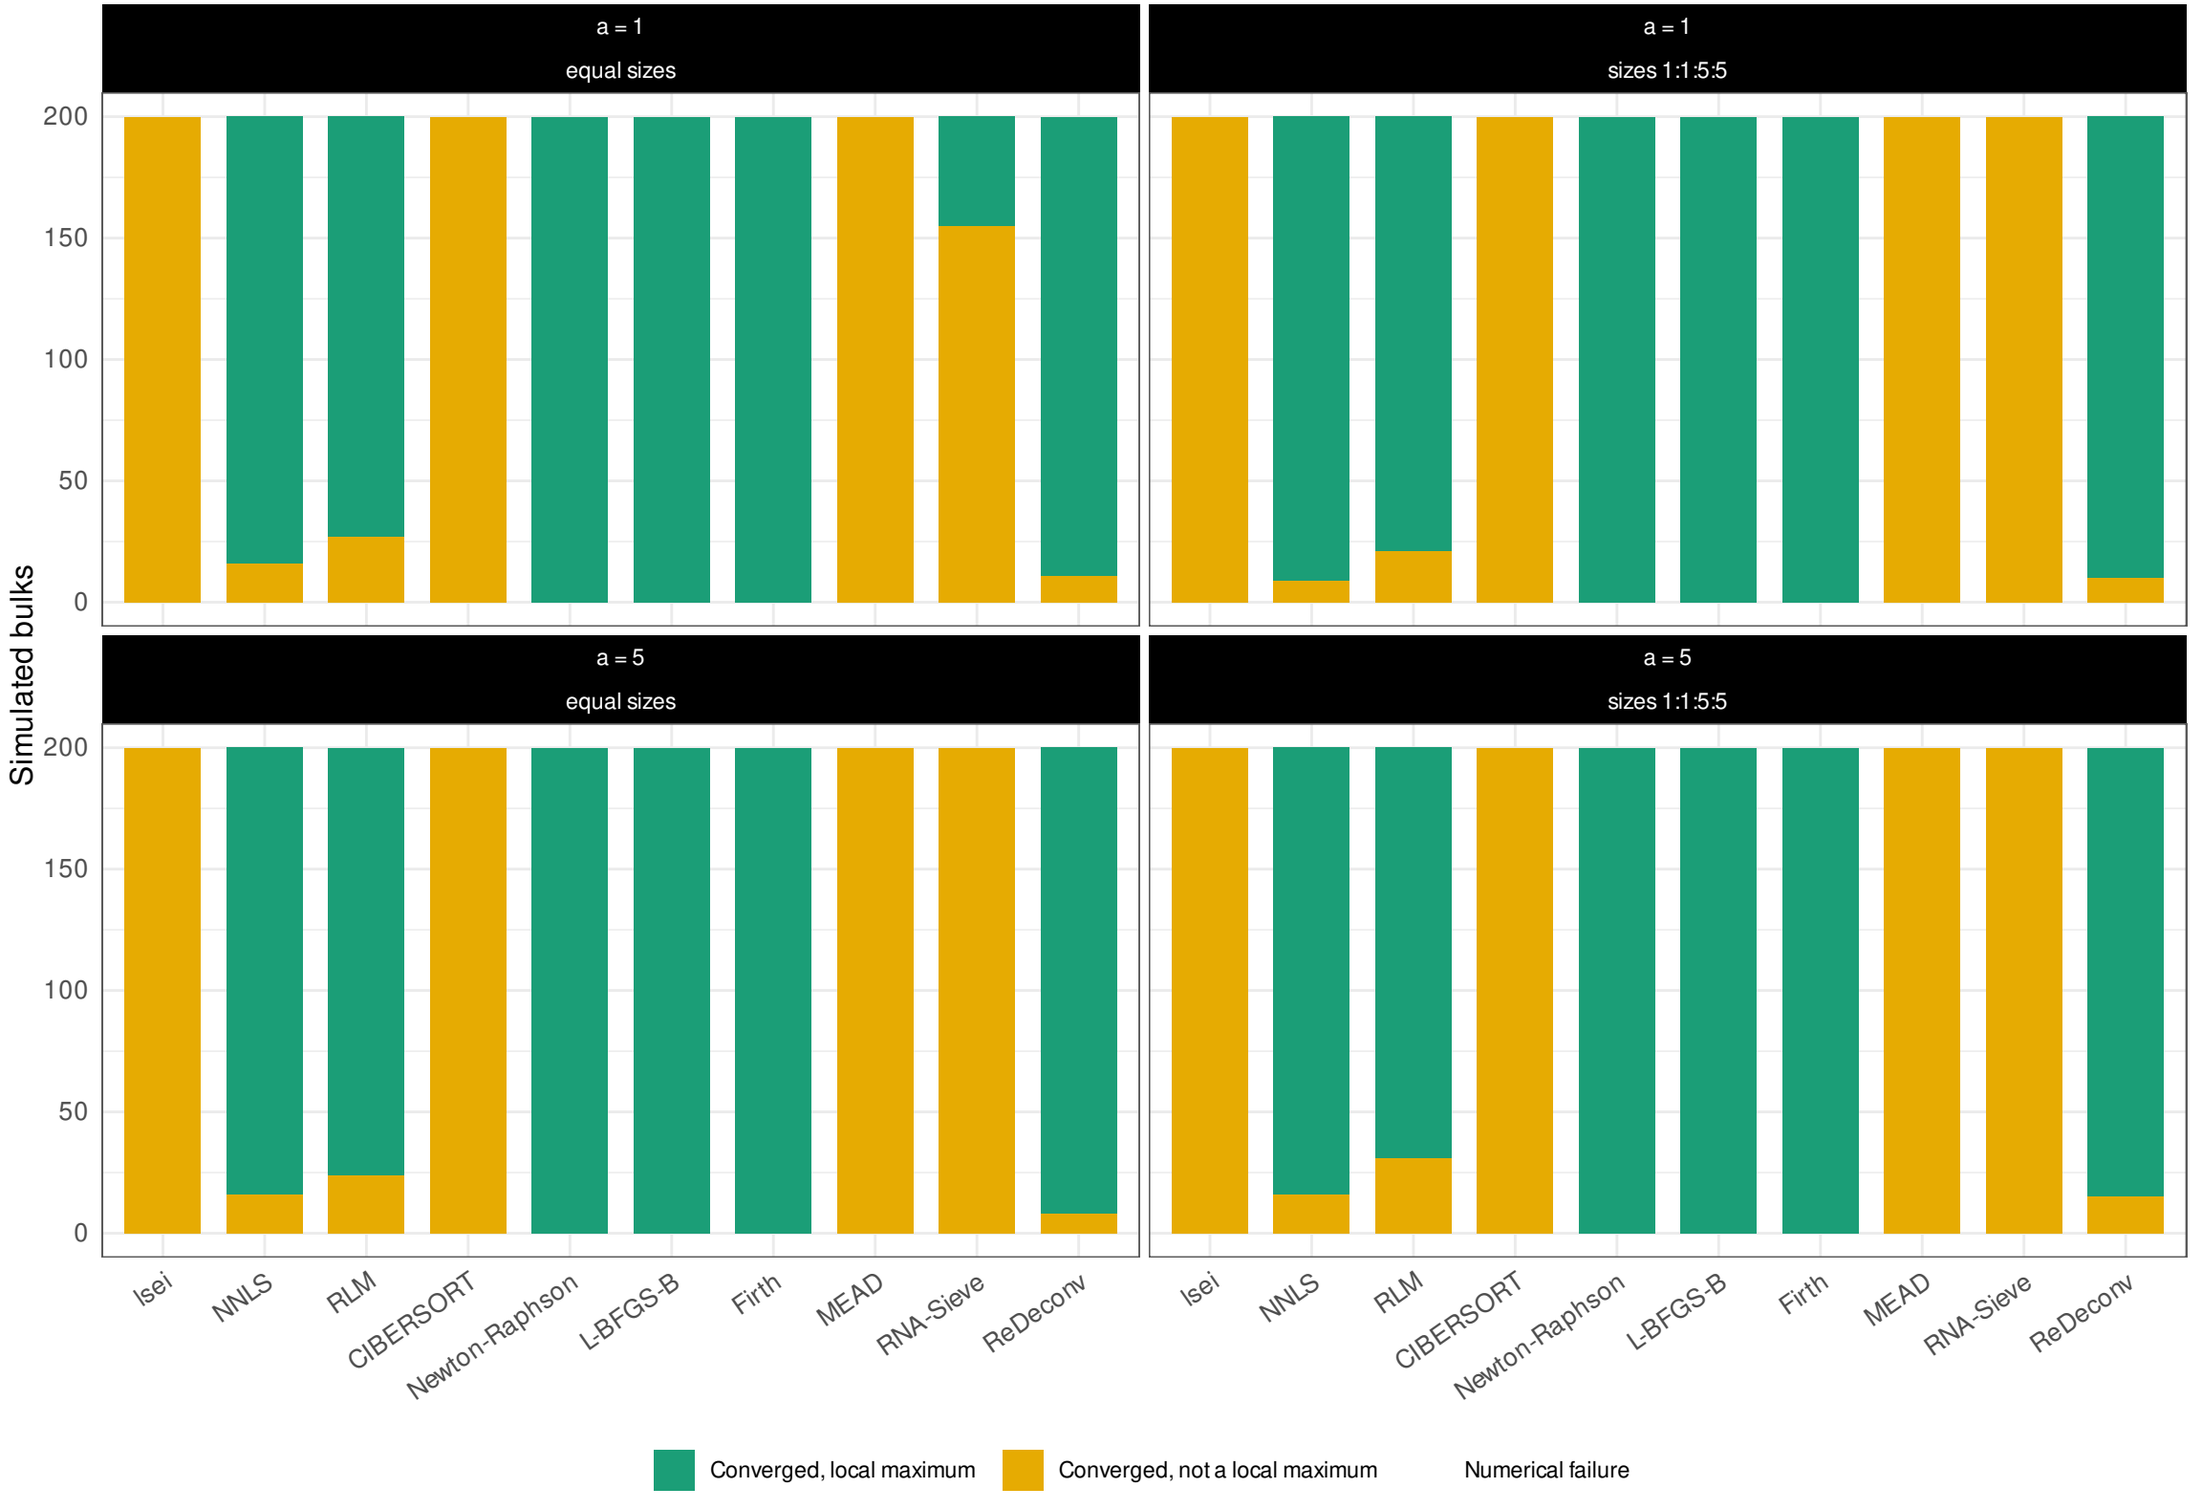

G = 20 / 1e+05 cells per bulk / balanced / high sibling overlap

Numerical failure: no finite estimate on the simplex. Theoretical failure: a finite estimate that is not a local maximum of the DeCovarT likelihood.
